Angular frequency ω : rad/s; f : Hz

$$\omega = 2\pi f \qquad f = \frac{\omega}{2\pi}$$

Phase velocity m/s ; *nonmagnetic*: $\mu_r = 1$

$$u_p = \frac{c}{\sqrt{\epsilon_r}} \qquad c = 3 \times 10^8 \text{ m/s}$$

Wavenumber k rad/m

$$k = \frac{\omega}{u_p} = \frac{2\pi}{\lambda} = \frac{\omega\sqrt{\epsilon_r}}{c}$$

Wavelength & impedance m & Ω

$$\lambda = \frac{u_p}{f} = \frac{2\pi}{k} \text{ (m)} \qquad \eta = \frac{\eta_0}{\sqrt{\epsilon_r}} \text{ (}\Omega\text{)}, \quad \eta_0 = 377 \text{ }\Omega$$

Order: $\omega \rightarrow u_p \rightarrow k \rightarrow \lambda \rightarrow \eta$. Base: $\mathbf{E} = E_0 \cos(\omega t \pm kx + \phi_0)\hat{e}$.

LOSSLESS PLANE WAVE — E AND H

General E

$$\mathbf{E} = E_0 \cos(\omega t - k\hat{k} \cdot \mathbf{r} + \phi_0)\hat{e}$$

$\hat{k}$ = direction of travel (unit vector), e.g. $+y \Rightarrow \hat{k} = \hat{y}$.
 k = wavenumber (rad/m): how fast phase changes in space; $k = \omega\sqrt{\epsilon_r}/c = 2\pi/\lambda$.
 ϕ_0 = initial phase constant (rad): shift set by given condition at known t , position.
 $\hat{e}$ = polarization direction of $\mathbf{E}$ (unit vector), e.g. E along $x \Rightarrow \hat{e} = \hat{x}$.
 $\mathbf{r} = x\hat{x} + y\hat{y} + z\hat{z}$, so $\hat{k} \cdot \mathbf{r}$ picks the axis, e.g. $\hat{k} = \hat{y} \Rightarrow \hat{k} \cdot \mathbf{r} = y$.
H from **E** $\hat{k}$, $\hat{E}$, $\hat{H}$ form right-hand set

$$\mathbf{H} = \frac{1}{\eta} (\hat{k} \times \mathbf{E})$$

Find ϕ_0 given $E = E_1$ at $t = 0$, position r_0

$$E_0 \cos(-kr_0 + \phi_0) = E_1 \Rightarrow \phi_0 = \cos^{-1}\left(\frac{E_1}{E_0}\right) + kr_0$$

$\cos^{-1}$ gives $[0, \pi]$; take ϕ_0 in that range.

Step 4 — time domain

$$Ae^{j\phi} e^{-\alpha y} \xrightarrow{\text{Re}\{e^{j\omega t}\}} Ae^{-\alpha y} \cos(\omega t - \beta y + \phi)$$

Convert each component $A + jB \rightarrow |Z|\angle\theta$ first.
