

## DIPOLE TYPE BY LENGTH

**STEP 0 — always start here**  $\lambda$  = wavelength (m),  $l$  = antenna rod length (m),  $c=3\times 10^8$  m/s

| $\lambda = \frac{c}{f}$ (m) | ratio $\frac{l}{\lambda} \rightarrow$ | pick row below                                             |
|-----------------------------|---------------------------------------|------------------------------------------------------------|
| $l/\lambda$                 | Type                                  | Use formula                                                |
| < 1/50                      | Hertzian (short)                      | HERTZIAN $S(R, \theta)$ , $D=1.5$                          |
| = 1/4                       | Quarter-wave                          | ARB formula, $\pi l/\lambda = \pi/4$                       |
| = 1/2                       | Half-wave                             | half-wave shortcut, $D=1.64$ , $R_{\text{rad}}=73\ \Omega$ |
| = 1                         | Full-wave                             | ARB, $D=2.41$ , $R_{\text{rad}}=199\ \Omega$               |
| other                       | Arbitrary                             | ARB formula                                                |

If  $l/\lambda < 1/50$  STOP and use Hertzian. Do NOT plug small  $l$  into the arbitrary formula — wrong shape.

## HERTZIAN DIPOLE — $S(R, \theta)$

|                                                                                                                                                            |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Far-field E,H phasors <small>small <math>l \ll \lambda</math></small>                                                                                      |
| $\vec{E}_\theta = \frac{jI_0 k l \eta_0}{4\pi R} e^{-jkR} \sin \theta$ , $\vec{H}_\phi = \vec{E}_\theta / \eta_0$                                          |
| Power density $l/\lambda < 1/50$ ; far field                                                                                                               |
| $S(R, \theta) = \frac{\eta_0 k^2 I_0^2 l^2}{32\pi^2 R^2} \sin^2 \theta = S_{\text{max}} \sin^2 \theta$ (W/m <sup>2</sup> )                                 |
| $l$ rod length (m); $I_0$ peak current (A); $R$ obs. dist. (m); $\theta$ from dipole axis; $k=2\pi/\lambda$ (rad/m); $\eta_0=120\pi \approx 377\ \Omega$ . |
| Max @ broadside $\theta_{\text{max}} = \pi/2$ ; $D$ exact $D=1.5$ (1.76 dB)                                                                                |
| Total radiated power $P_{\text{rad}} = \frac{\eta_0 \pi}{3} (I_0 l/\lambda)^2$ (W)                                                                         |

## ARBITRARY-LENGTH DIPOLE — $S(\theta)$

|                                                                                                                                                                                        |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power density at $R$ any $l$                                                                                                                                                           |
| $S(\theta) = \frac{15I_0^2}{\pi R^2} \left[ \frac{\cos(\frac{\pi l}{\lambda} \cos \theta) - \cos(\frac{\pi l}{\lambda})}{\sin \theta} \right]^2$                                       |
| At $\theta = 0, \pi$ : bracket is 0/0. L'Hôpital $\Rightarrow S=0$ (no axial radiation). TI-36X Pro alt: evaluate bracket at $\theta = 0.001$ rad $\rightarrow$ tiny $\rightarrow 0$ . |
| Normalized pattern <i>dimensionless</i> $F(\theta) = S(\theta)/S_{\text{max}}$                                                                                                         |
| Quarter-wave $l = \lambda/4$ $\pi l/\lambda = \pi/4$ , $\cos(\pi/4) = \sqrt{2}/2$                                                                                                      |
| $\frac{S(\theta)}{S_0} = \left[ \frac{\cos(\frac{\pi}{4} \cos \theta) - \frac{\sqrt{2}}{2}}{\sin \theta} \right]^2$ , $S_0 = \frac{15I_0^2}{\pi R^2}$                                  |
| $S_{\text{max}} = S(\pi/2) = S_0 \left(1 - \frac{\sqrt{2}}{2}\right)^2 \approx 0.0858 S_0$                                                                                             |
| $D=1.64$ , $R_{\text{rad}}=36.5\ \Omega$ , $\theta_{\text{max}} = \pi/2$ .                                                                                                             |
| Half-wave $l = \lambda/2$ $\pi l/\lambda = \pi/2$ , <i>shortcut form</i>                                                                                                               |
| $S(\theta) = \frac{15I_0^2}{\pi R^2} \frac{\cos^2(\frac{\pi}{2} \cos \theta)}{\sin^2 \theta}$                                                                                          |
| $D=1.64$ , $R_{\text{rad}}=73\ \Omega$ , $\theta_{\text{max}} = \pi/2$ .                                                                                                               |

## COMMON ANGLES (deg $\leftrightarrow$ rad, trig values)

|                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------|
| Conversion <i>multiply by <math>\pi/180</math> or <math>180/\pi</math></i>                                                          |
| $\theta_{\text{rad}} = \theta_{\text{deg}} \cdot \frac{\pi}{180}$ $\theta_{\text{deg}} = \theta_{\text{rad}} \cdot \frac{180}{\pi}$ |
| °    rad    sin $\theta$ cos $\theta$ sin <sup>2</sup> $\theta$ cos <sup>2</sup> $\theta$                                           |
| 0    0    0    1    0    1                                                                                                          |
| 30 $\pi/6$ 1/2 $\sqrt{3}/2$ 1/4    3/4                                                                                              |
| 45 $\pi/4$ $\sqrt{2}/2$ $\sqrt{2}/2$ 1/2    1/2                                                                                     |

| 90 $\pi/2$ 1    0    1    0                                                                                                         |
| 180 $\pi$ 0    -1    0    1                                                                                                         |

Antenna formulas usually take  $\theta$  in rad. RAD mode on calc.

## LINEAR ANTENNA ARRAY

|                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------|
| Setup $N$ identical elements along axis, spacing $d$                                                                     |
| elem pos $z_i = id$ , $i = 0, \dots, N-1$ ; $A_i = a_i e^{j\psi_i}$                                                      |
| Equal phase ( $\psi_i=0$ ) $\Rightarrow$ broadside beam ( $\theta_{\text{max}} = \pi/2$ ).                               |
| Progressive phase $\psi_i = i\alpha \Rightarrow$ steered beam at $\cos \theta_{\text{max}} = -\alpha/(kd)$ .             |
| Pattern multiplication $S_e$ = single element pattern                                                                    |
| $S(R, \theta, \phi) = S_e(R, \theta, \phi) F_a(\theta)$                                                                  |
| Array factor (general) $k=2\pi/\lambda$                                                                                  |
| $F_a(\theta) = \left  \sum_{i=0}^{N-1} A_i e^{jkid \cos \theta} \right ^2$                                               |
| Uniform $A_i=1$ , equal phase <i>closed form</i>                                                                         |
| $F_a(\theta) = \frac{\sin^2(N\gamma/2)}{\sin^2(\gamma/2)}$ , $\gamma = kd \cos \theta$                                   |
| Peak: $F_a^{\text{max}} = N^2$ at $\gamma=0$ (broadside, $\theta = \pi/2$ ). Normal-ize: $F_a^{\text{norm}} = F_a/N^2$ . |
| HPBW (broadside, uniform) <i>use <math>Nd</math>, not <math>(N-1)d</math></i>                                            |
| $\beta \approx 0.88 \frac{\lambda}{Nd}$ (rad) = $50.8^\circ \cdot \frac{\lambda}{Nd}$                                    |
| Grating lobes appear if $d > \lambda$ (broadside). Avoid.                                                                |

## DIPOLE

|                                                  |
|--------------------------------------------------|
| $l$ — antenna length (m)                         |
| $\lambda = c/f$ (m); $c=3\times 10^8$ m/s        |
| $I_0$ — peak current (A)                         |
| $k=2\pi/\lambda$ (rad/m)                         |
| $R$ — obs. dist. (m); $\theta$ from axis         |
| $\eta_0=120\pi \approx 377\ \Omega$              |
| $S(R, \theta)$ — pwr density (W/m <sup>2</sup> ) |

## BEAM

|                                           |
|-------------------------------------------|
| $F(\theta) = S/S_{\text{max}}$ (unitless) |
| $a$ — coef. on $\theta^2$ in Gaussian     |
| $\beta$ — HPBW (rad or °)                 |
| $\Omega_p$ — pattern solid angle (sr)     |
| $D=4\pi/\Omega_p$ — directivity           |
| $\xi$ — rad. efficiency; $G=\xi D$        |
| $D_{\text{dB}} = 10 \log_{10} D$          |

## BEAM PARAMETERS — $\beta$ , $\Omega_p$ , $D$

|                                                                                                                                           |
|-------------------------------------------------------------------------------------------------------------------------------------------|
| Normalize <i>always start here</i>                                                                                                        |
| $F(\theta) = S(\theta)/S_{\text{max}}$ (unitless)                                                                                         |
| Beamwidth $\beta$ at threshold $X$                                                                                                        |
| Set $F(\theta_X) = X$ , solve for $\theta_X$ ; $\beta = 2\theta_X$ (symmetric)                                                            |
| Threshold $X=10^{\text{dB}/10}$ $\theta_X$ (Gauss. short-cut)                                                                             |
| HPBW (−3 dB)    0.5 $\sqrt{\frac{\ln 2}{a}}$                                                                                              |
| −6 dB    0.25 $\sqrt{\frac{\ln 4}{a}}$                                                                                                    |
| −10 dB    0.1 $\sqrt{\frac{\ln 10}{a}}$                                                                                                   |

| Pattern solid angle $\Omega_p$ <i>recognize pattern, look up</i>                                                                          |
| $\Omega_p = \int_0^{2\pi} \int_0^\pi F(\theta) \sin \theta \, d\theta \, d\phi$ (sr)                                                      |
| No $\phi$ dep.: $\Omega_p = 2\pi \int_0^\pi F(\theta) \sin \theta \, d\theta$ .                                                           |
| $\theta$ is the integration variable — DON'T plug in a number for $\theta$ (e.g. $\theta_{1/2}$ ). Integrate over $\theta \in [0, \pi]$ . |
| Pattern $F(\theta)$ $\Omega_p$ (sr)                                                                                                       |
| Isotropic ( $F=1$ ) $4\pi \approx 12.57$                                                                                                  |
| Hertzian sin <sup>2</sup> $\theta$ $8\pi/3 \approx 8.38$                                                                                  |
| Half-wave dipole $\approx 7.66$                                                                                                           |
| Narrow Gauss $e^{-a\theta^2}$ $\pi/a = \pi\theta_{1/2}^2 / \ln 2$                                                                         |
| 2-axis HPBW (aperture) $\beta_{xz} \cdot \beta_{yz}$                                                                                      |
| Other (use integral)    numerical                                                                                                         |

TI-36X Pro: [2nd] [d/dx] for  $\int_{\square}^{\square}$ , RAD mode, multiply by  $2\pi$ .

|                                                                                                                                                                                          |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Directivity $D$ <i>always <math>D=4\pi/\Omega_p</math>; common shortcuts below</i>                                                                                                       |
| $D = \frac{4\pi}{\Omega_p}$ (unitless) $D_{\text{dB}} = 10 \log_{10} D$                                                                                                                  |
| WORD TRAP: “direction of max radiation” = angle $\theta_{\text{max}}$ (rad/deg). “directivity” = unitless number $D$ . Different things!                                                 |
| Dipoles $\rightarrow$ COMMON DIPOLE PARAMS table. Aperture: $D \approx 4\pi A_p/\lambda^2$ . 2-axis HPBW: $D \approx 4\pi/(\beta_{xz}\beta_{yz})$ . Circular: $D \approx 4\pi/\beta^2$ . |
| Gain (if asked) $\xi = \text{rad. eff.}$ , $0 < \xi \leq 1$                                                                                                                              |
| $G = \xi D$ $G_{\text{dB}} = 10 \log_{10} G$                                                                                                                                             |
| Lossless / ideal antenna $\Rightarrow G=D$ .                                                                                                                                             |

## COMMON DIPOLE PARAMETERS

| Type      | $l$               | $D$  | $D_{\text{dB}}$ | $R_{\text{rad}}$ ( $\Omega$ ) |
|-----------|-------------------|------|-----------------|-------------------------------|
| Isotropic | N/A               | 1    | 0               | —                             |
| Hertzian  | $< \lambda/50$    | 1.5  | 1.76            | $80\pi^2 (l/\lambda)^2$       |
| Half-wave | $\lambda/2$       | 1.64 | 2.15            | 73.2                          |
| Monopole  | $\lambda/4$ (gnd) | 1.64 | 2.15            | 36.6                          |
| Full-wave | $\lambda$         | 2.41 | 3.82            | 199                           |

Half-wave:  $P_{\text{rad}} = 36.6 I_0^2$  W. Monopole ( $\lambda/4$  above ground): same patt. as half-wave but  $P_{\text{rad}}$ ,  $R_{\text{rad}}$  halved. Lossless antenna ( $\xi=1$ )  $\Rightarrow G=D$ . So in Friis, use  $G_t$ ,  $G_r$  = these  $D$  values (e.g. half-wave  $G=1.64$ ).

## ANTENNA AREAS ( $A_e$ , $A_p$ )

|                                                                                                    |
|----------------------------------------------------------------------------------------------------|
| Effective area <i>antenna's RX cross section; <math>D</math> from BEAM PARAMS or table above</i>   |
| $A_e = \frac{\lambda^2 D}{4\pi}$ (m <sup>2</sup> )                                                 |
| Physical cross section <i>wire dipole, diameter <math>d</math>; <math>l</math> see table above</i> |
| $A_p = l d$ (m <sup>2</sup> , any dipole)                                                          |
| Inverse: $D$ from $A_e$                                                                            |
| $D = \frac{4\pi A_e}{\lambda^2}$ (unitless)                                                        |
| Hertzian special case $D=1.5$                                                                      |
| $A_e^{\text{Hertz}} = \frac{3\lambda^2}{8\pi} \approx 0.119\lambda^2$ (m <sup>2</sup> )            |
| Thin wire: $A_e \gg A_p$ . Antenna captures field over $\sim \lambda$ .                            |

## FRIIS TRANSMISSION FORMULA

Pwr density at RX, then RX pwr  $G_t, G_r$  linear gains;  $\lambda = c/f$

$$S_r = \frac{G_t P_t}{4\pi R^2} \text{ (W/m}^2\text{)}; \quad P_r = G_t G_r \left( \frac{\lambda}{4\pi R} \right)^2 P_t \text{ (W)}$$

Equivalent:  $P_r = S_r A_{e,r}$ .

Solve for  $R$  *max range*

$$R = \frac{\lambda}{4\pi} \sqrt{\frac{G_t G_r P_t}{P_r}} \text{ (m)}$$

Equivalent form using  $A_e$  *recv. area form*

$$P_r = \frac{G_t P_t A_{e,r}}{4\pi R^2}, \quad G_r = \frac{4\pi A_{e,r}}{\lambda^2}$$

Free-space path loss:  $L_{fs} = (4\pi R/\lambda)^2$ , so  $P_r = G_t G_r P_t / L_{fs}$ .

General form (off-axis) *when patterns NOT peak-aligned*

$$P_r = G_t G_r \left( \frac{\lambda}{4\pi R} \right)^2 P_t F_t(\theta_t, \phi_t) F_r(\theta_r, \phi_r)$$

$F_t, F_r$  normalized patterns at the link directions;  $F=1$  when aligned.

Recipe 1.  $\lambda = c/f$ . 2. Convert dB gains to linear:  $G=10^{G_{\text{dB}}/10}$ .

3. If TX is “half-wave dipole” use  $G_t=1.64$ . 4. Plug into Friis.

Use linear  $G$ , not dB. Convert FIRST.

## dB $\leftrightarrow$ LINEAR

Works for any power-like quantity:  $G$  gain,  $D$  directivity,  $P_r/P_t$ , SNR, etc.

$$X_{\text{dB}} = 10 \log_{10} X_{\text{lin}} \quad X_{\text{lin}} = 10^{X_{\text{dB}}/10}$$

$$\text{e.g. } D_{\text{dB}} = 10 \log_{10} D; \quad G_{\text{dB}} = 10 \log_{10} G; \quad \text{SNR}_{\text{dB}} = 10 \log_{10} (P_r/P_N)$$

| dB | linear | dB  | linear |
|----|--------|-----|--------|
| 0  | 1      | 10  | 10     |
| 3  | 2      | 13  | 20     |
| 6  | 4      | 20  | 100    |
| 7  | 5      | 30  | 1000   |
| −3 | 0.5    | −10 | 0.1    |

Memorize: 3 dB  $\leftrightarrow \times 2$ , 10 dB  $\leftrightarrow \times 10$ . Add dB = multiply linear.

For E-field / amplitude use 20 log not 10 log (power  $\propto E^2$ ).

## NOISE & SNR

|                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------|
| Noise power <i>thermal noise into matched receiver</i>                                                                  |
| $P_N = k_B T_{\text{sys}} B$ (W)                                                                                        |
| $k_B = 1.38 \times 10^{-23}$ J/K; $T_{\text{sys}}$ system noise temp (K); $B$ receiver bandwidth (Hz).                  |
| Signal-to-noise ratio                                                                                                   |
| $\text{SNR} = \frac{P_{\text{rec}}}{P_N}$ (unitless) $\text{SNR}_{\text{dB}} = 10 \log_{10} \frac{P_{\text{rec}}}{P_N}$ |
| Typical comm. link needs SNR > 10 dB for usable signal.                                                                 |

## APERTURE ANTENNAS (horn, dish)

$A_p$  physical aperture area (m<sup>2</sup>);  $A_e$  effective area (m<sup>2</sup>,  $= \lambda^2 D/4\pi$ );  $\beta_{xz}, \beta_{yz}$  HPBW's in two planes (rad);  $\ell$ ,  $d$  aperture side / diameter (m).

|                                                                                             |
|---------------------------------------------------------------------------------------------|
| Directivity (any shape, uniform illum.)                                                     |
| $D \approx \frac{4\pi A_p}{\lambda^2}$ (unitless) $\Rightarrow A_e \approx A_p$             |
| Directivity from beamwidths <i>any aperture</i>                                             |
| $D \approx \frac{4\pi}{\beta_{xz}\beta_{yz}}$ (use rad); circular: $D \approx 4\pi/\beta^2$ |

HPBW and  $D$  by aperture shape *uniform illum.;  $\beta$  in rad*
