| 180                                                               | $\pi$                                                             | 0            | -1           | 0                         | 1                         |  |

Antenna formulas usually take  $\theta$  in rad. RAD mode on calc.

## LINEAR ANTENNA ARRAY

|                                                                                                                            |  |
|----------------------------------------------------------------------------------------------------------------------------|--|
| <b>Setup</b> $N$ identical elements along axis, spacing $d$                                                                |  |
| elem pos $z_i = id$ , $i = 0, \dots, N-1$ ; $A_i = a_i e^{j\psi_i}$                                                        |  |
| Equal phase ( $\psi_i = 0$ ) $\Rightarrow$ broadside beam ( $\theta_{\text{max}} = \pi/2$ ).                               |  |
| Progressive phase $\psi_i = i\alpha \Rightarrow$ steered beam at $\cos \theta_{\text{max}} = -\alpha/(kd)$ .               |  |
| <b>Pattern multiplication</b> $S_e = \text{single element pattern}$                                                        |  |
| $S(R, \theta, \phi) = S_e(R, \theta, \phi) F_a(\theta)$                                                                    |  |
| <b>Array factor (general)</b> $k = 2\pi/\lambda$                                                                           |  |
| $F_a(\theta) = \left  \sum_{i=0}^{N-1} A_i e^{jkid \cos \theta} \right ^2$                                                 |  |
| <b>Uniform</b> $A_i = 1$ , equal phase closed form                                                                         |  |
| $F_a(\theta) = \frac{\sin^2(N\gamma/2)}{\sin^2(\gamma/2)}$ , $\gamma = kd \cos \theta$                                     |  |
| Peak: $F_a^{\text{max}} = N^2$ at $\gamma = 0$ (broadside, $\theta = \pi/2$ ). Normal-ize: $F_a^{\text{norm}} = F_a/N^2$ . |  |
| <b>HPBW (broadside, uniform)</b> use $Nd$ , not $(N-1)d$                                                                   |  |
| $\beta \approx 0.88 \frac{\lambda}{Nd}$ (rad) = $50.8^\circ \cdot \frac{\lambda}{Nd}$                                      |  |
| Grating lobes appear if $d > \lambda$ (broadside). Avoid.                                                                  |  |

## DIPOLE

|                                                      |
|------------------------------------------------------|
| $l$ — antenna length (m)                             |
| $\lambda = c/f$ (m); $c = 3 \times 10^8 \text{ m/s}$ |
| $I_0$ — HPBW current (A)                             |
| $k = 2\pi/\lambda$ (rad/m)                           |
| $R$ — obs. dist. (m); $\theta$ from axis             |
| $\eta_0 = 120\pi \approx 377 \Omega$                 |
| $S(R, \theta)$ — pwr density (W/m <sup>2</sup> )     |

## BEAM

|                                           |
|-------------------------------------------|
| $F(\theta) = S/S_{\text{max}}$ (unitless) |
| $a$ — coef. on $\theta^2$ in Gaussian     |
| $\beta$ — HPBW (rad or °)                 |
| $\Omega_p$ — pattern solid angle (sr)     |
| $D = 4\pi/\Omega_p$ — directivity         |
| $\xi$ — rad. efficiency; $G = \xi D$      |
| $D_{\text{dB}} = 10 \log_{10} D$          |

## FRIIS / dB

|                                                  |
|--------------------------------------------------|
| $P_t, P_r$ — TX/RX power (W)                     |
| $G_t, G_r$ — linear gains                        |
| $S_r = G_t P_t / (4\pi R^2)$ (W/m <sup>2</sup> ) |
| $P_r = G_t G_r (\lambda/4\pi R)^2 P_t$           |
| $G = 10^{G_{\text{dB}}/10}$                      |
| 3 dB = $\times 2$ , 10 dB = $\times 10$          |
| $P_N = k_B T_{\text{sys}} B$ (W)                 |

## APERTURE

|                                                |
|------------------------------------------------|
| $A_p$ — physical area (m <sup>2</sup> )        |
| $A_e = \lambda^2 D / (4\pi)$ (m <sup>2</sup> ) |
| $A_e \approx A_p$ for aperture                 |
| $D \approx 4\pi A_p / \lambda^2$ (unitless)    |
| $\beta \approx 0.88 \lambda / \ell$ (rect/sq.) |
| $\beta \approx 1.02 \lambda / d$ (circular)    |
| $2A_p \Rightarrow 2D$ , $\beta/\sqrt{2}$       |

## ARRAY

|                                                 |
|-------------------------------------------------|
| $N$ — number of elements                        |
| $d$ — spacing (m)                               |
| $\gamma = kd \cos \theta$                       |
| $F_a = \sin^2(N\gamma/2) / \sin^2(\gamma/2)$    |
| $F_a^{\text{max}} = N^2$ at $\theta = \pi/2$    |
| $F_a^{\text{norm}} = F_a/N^2$                   |
| $\beta \approx 0.88 \lambda / (Nd)$ (broadside) |

## BEAM PARAMETERS — $\beta, \Omega_p, D$

| $G = \xi D$                                                                                                                                                                                     | $G_{\text{dB}} = 10 \log_{10} G$ |  |
| Lossless / ideal antenna $\Rightarrow G = D$ .                                                                                                                                                  |                                  |  |

## COMMON DIPOLE PARAMETERS

| Type        | $l$               | $D$  | $D_{\text{dB}}$ | $R_{\text{rad}}$ ( $\Omega$ ) |
|-------------|-------------------|------|-----------------|-------------------------------|
| Isotropic   | N/A               | 1    | 0               | —                             |
| Hertzian    | $< \lambda/50$    | 1.5  | 1.76            | $80\pi^2 (l/\lambda)^2$       |
| Half-wave   | $\lambda/2$       | 1.64 | 2.15            | 73.2                          |
| $\lambda/4$ | $\lambda/4$ (gnd) | 1.64 | 2.15            | 36.6                          |
| monopole    |                   |      |                 |                               |
| Full-wave   | $\lambda$         | 2.41 | 3.82            | 199                           |

Half-wave:  $P_{\text{rad}} = 36.6 I_0^2 W$ .  $\lambda/4$  monopole (above ground): same patt. as half-wave but  $P_{\text{rad}}, R_{\text{rad}}$  halved.  
Lossless antenna ( $\xi = 1$ )  $\Rightarrow G = D$ . So in Friis, use  $G_t, G_r = \text{these } D \text{ values (e.g. half-wave } G = 1.64)$ .

## EFFECTIVE AREA $A_e$

|                                                                                          |  |
|------------------------------------------------------------------------------------------|--|
| <b>Definition</b> antenna's RX cross section (m <sup>2</sup> )                           |  |
| $A_e = \frac{\lambda^2 D}{4\pi}$ (m <sup>2</sup> )                                       |  |
| <b>Physical cross section</b> wire dipole, diameter $d$                                  |  |
| $A_p = l d = \frac{\lambda}{2} d$ (half-wave)                                            |  |
| <b>Inverse:</b> $D$ from $A_e$                                                           |  |
| $D = \frac{4\pi A_e}{\lambda^2}$ (unitless)                                              |  |
| <b>Hertzian special case</b> $D = 1.5$                                                   |  |
| $A_e^{\text{Hertz}} = \frac{3\lambda^2}{8\pi} \approx 0.119 \lambda^2$ (m <sup>2</sup> ) |  |
| Thin wire: $A_e \gg A_p$ . Antenna captures field over $\sim \lambda$ .                  |  |

## FRIIS TRANSMISSION FORMULA

|                                                                                                                     |  |
|---------------------------------------------------------------------------------------------------------------------|--|
| <b>Pwr density at RX</b> , then RX pwr $G_t, G_r$ linear gains; $\lambda = c/f$                                     |  |
| $S_r = \frac{G_t P_t}{4\pi R^2}$ (W/m <sup>2</sup> ); $P_r = G_t G_r \left(\frac{\lambda}{4\pi R}\right)^2 P_t$ (W) |  |
| Equivalent: $P_r = S_r A_{e,r}$ .                                                                                   |  |
| Solve for $R$ max range                                                                                             |  |
| $R = \frac{\lambda}{4\pi} \sqrt{\frac{G_t G_r P_t}{P_r}}$ (m)                                                       |  |
| <b>Equivalent form using <math>A_e</math> recv. area form</b>                                                       |  |
| $P_r = \frac{G_t P_t A_{e,r}}{4\pi R^2}$ , $G_r = \frac{4\pi A_{e,r}}{\lambda^2}$                                   |  |
| Free-space path loss: $L_{fs} = (4\pi R/\lambda)^2$ , so $P_r = G_t G_r P_t / L_{fs}$ .                             |  |
| <b>General form (off-axis)</b> when patterns NOT peak-aligned                                                       |  |
| $P_r = G_t G_r \left(\frac{\lambda}{4\pi R}\right)^2 P_t F_t(\theta_t, \phi_t) F_r(\theta_r, \phi_r)$               |  |
| $F_t, F_r$ normalized patterns at the link directions; $F = 1$ when aligned.                                        |  |
| Recipe 1. $\lambda = c/f$ . 2. Convert dB gains to linear: $G = 10^{G_{\text{dB}}/10}$ .                            |  |
| 3. If TX is “half-wave dipole” use $G_t = 1.64$ . 4. Plug into Friis.                                               |  |
| Use linear $G$ , not dB. Convert FIRST.                                                                             |  |

## dB $\leftrightarrow$ LINEAR

| Works for any power-like quantity: $G$ gain, $D$ directivity, $P_r/P_t$ , SNR, etc.                                        |           |     |      |
|----------------------------------------------------------------------------------------------------------------------------|-----------|-----|------|
| $X_{\text{dB}} = 10 \log_{10} X_{\text{lin}}$ $X_{\text{lin}} = 10^{X_{\text{dB}}/10}$                                     |           |     |      |
| e.g. $D_{\text{dB}} = 10 \log_{10} D$ ; $G_{\text{dB}} = 10 \log_{10} G$ ;<br>$SNR_{\text{dB}} = 10 \log_{10} (P_r/P_N)$ . |           |     |      |
| dB linear                                                                                                                  | dB linear |     |      |
| 0                                                                                                                          | 1         | 10  | 10   |
| 3                                                                                                                          | 2         | 13  | 20   |
| 6                                                                                                                          | 4         | 20  | 100  |
| 7                                                                                                                          | 5         | 30  | 1000 |
| −3                                                                                                                         | 0.5       | −10 | 0.1  |
| Memorize: $3 \text{ dB} \Leftrightarrow \times 2$ , $10 \text{ dB} \Leftrightarrow \times 10$ . Add dB = multiply linear.  |           |     |      |
| For E-field / amplitude use $20 \log$ not $10 \log$ (power $\propto E^2$ ).                                                |           |     |      |

## NOISE & SNR

|                                                                                                                 |  |
|-----------------------------------------------------------------------------------------------------------------|--|
| <b>Noise power</b> thermal noise into matched receiver                                                          |  |
| $P_N = k_B T_{\text{sys}} B$ (W)                                                                                |  |
| $k_B = 1.38 \times 10^{-23} \text{ J/K}$ ; $T_{\text{sys}}$ system noise temp (K); $B$ receiver bandwidth (Hz). |  |
| <b>Signal-to-noise ratio</b>                                                                                    |  |
| $SNR = \frac{P_{\text{rec}}}{P_N}$ (unitless) $SNR_{\text{dB}} = 10 \log_{10} \frac{P_{\text{rec}}}{P_N}$       |  |
| Typical comm. link needs $SNR > 10 \text{ dB}$ for usable signal.                                               |  |
