ANGLES — REFLECTION, TRANSMISSION, CRITICAL, BREWSTER

Reflection angle (Snell, reflection) <i>always</i> $\theta_r = \theta_i$ (from normal)	
Transmission/refraction (Snell, refraction) <i>single boundary; angles from normal</i>	
$\sin \theta_t = \sin \theta_i \sqrt{\frac{\epsilon_{r1}}{\epsilon_{r2}}} = \sin \theta_i \frac{n_1}{n_2}$	
Multilayer chain (Snell, chained) <i>stack of slabs $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$</i>	

$\sin \theta_{i+1} = \sin \theta_i \sqrt{\frac{\epsilon_{r,i}}{\epsilon_{r,i+1}}}$	
Air–slabs–air shortcut <i>outer media identical; collapse of Snell chain</i>	
$\theta_{\text{exit}} = \theta_{\text{incident}}$	
Critical angle θ_c <i>TIR when $n_1 > n_2$; no transmitted wave</i>	
$\sin \theta_c = \frac{n_2}{n_1} = \sqrt{\frac{\epsilon_{r2}}{\epsilon_{r1}}} \Rightarrow \theta_c = \arcsin\left(\frac{n_2}{n_1}\right)$	
Brewster angle θ_B ($\parallel$ -pol only) $\Gamma_{ } = 0$; <i>nonmag</i>	
$\tan \theta_B = \frac{n_2}{n_1} = \sqrt{\frac{\epsilon_{r2}}{\epsilon_{r1}}} \Rightarrow \theta_B = \arctan\left(\frac{n_2}{n_1}\right)$	
At θ_B : reflected wave is pure $\perp$ -pol ($\parallel$ reflection = 0); transmitted has both. Snell only sets angles. Reflection/transmission magnitudes need Fresnel coefficients ($\parallel$ vs $\perp$).

RECTANGULAR WAVEGUIDE — MODES

TE mode $E_z = 0, H_z \neq 0$ TM mode $H_z = 0, E_z \neq 0$	
Dimensions $a \times b$ with $a > b$ along $\hat{x}, \hat{y}$; wave in $\hat{z}$.	
E_x form (TE) <i>read m, n from arguments</i>	
$E_x \propto \cos\left(\frac{m\pi x}{a}\right) \sin\left(\frac{n\pi y}{b}\right) \sin(\omega t - \beta z)$	
coef. on $x = m\pi/a$; coef. on $y = n\pi/b$.	

Identify TE _{mn} vs TM _{mn} <i>cos/sin pattern of E_x is identical for both!</i>	
1. Read the problem statement (e.g. “a TE wave” $\rightarrow$ TE).	
2. If $m=0$ or $n=0$ in the mode label $\Rightarrow$ must be TE (TM forbids 0).	
3. Source field $H_z(x, y)$ given $\Rightarrow$ TE. Source field $E_z(x, y)$ given $\Rightarrow$ TM.	
TE allows at least one of $m, n \geq 1$ (other can be 0). TM needs both $m, n \geq 1$. So TE ₁₀ exists but TM ₁₀ doesn't.

$G = \xi D$ (unitless) $G_{\text{dB}} = 10 \log_{10} G$ (dB)		
Lossless / ideal antenna $\Rightarrow G = D$.		
$\xi = \frac{R_{\text{rad}}}{R_{\text{rad}} + R_{\text{loss}}} = \frac{P_{\text{rad}}}{P_{\text{rad}} + P_{\text{loss}}}$; $R_{\text{rad}} = 2P_{\text{rad}}/I_0^2$ (Ω); $R_{\text{in}} = R_{\text{rad}} + R_{\text{loss}}$.		

COMMON DIPOLE PARAMETERS

Lossless ($\xi = 1$): $G = D$.				
Type	l	D	D_{dB}	R_{rad} (Ω)
Isotropic	N/A	1	0	—
Hertzian	$< \lambda/50$	1.5	1.76	$80\pi^2 (l/\lambda)^2$
Half-wave	$\lambda/2$	1.64	2.15	73.2
Monopole	$\lambda/4$ (gnd)	1.64	2.15	36.6
Full-wave	λ	2.41	3.82	199
Half-wave: $P_{\text{rad}} = 36.6 I_0^2$ W. Monopole ($\lambda/4$ above ground): same patt. as half-wave but P_{rad} , R_{rad} halved.				

ANTENNA AREAS (A_e , A_p)

Effective area antenna's RX cross section; D from BEAM PARAMS or table above	
$A_e = \frac{\lambda^2 D}{4\pi}$ (m ²)	
Physical cross section wire dipole, diameter d; l see table above	
$A_p = l d$ (m ² , any dipole)	
Inverse: D from A_e	
$D = \frac{4\pi A_e}{\lambda^2}$ (unitless)	
Thin wire: $A_e \gg A_p$ (e.g., Hertzian $A_e = 3\lambda^2/8\pi \approx 0.119\lambda^2$).	

FRIS TRANSMISSION FORMULA

For each antenna's G : if given by NAME (“half-wave dipole” etc.) $\rightarrow$ COMMON DIPOLE PARAMS ($G = D$, lossless). Else (dB/linear value given) $\rightarrow$ use as given (convert dB $\rightarrow$ linear).	
Pwr density at RX, then RX pwr G_t, G_r linear gains; $\lambda = c/f$	
$S_r = \frac{G_t P_t}{4\pi R^2}$ (W/m ²); $P_r = G_t G_r \left(\frac{\lambda}{4\pi R} \right)^2 P_t$ (W)	
Equivalent: $P_r = S_r A_{e,r}$.	
Solve for R range	
$R = \frac{\lambda}{4\pi} \sqrt{\frac{G_t G_r P_t}{P_r}}$ (m)	
Equivalent form using A_e recv. area form	
$P_r = \frac{G_t P_t A_{e,r}}{4\pi R^2}$, $G_r = \frac{4\pi A_{e,r}}{\lambda^2}$	
Free-space path loss: $L_{fs} = (4\pi R/\lambda)^2$, so $P_r = G_t G_r P_t / L_{fs}$.	
General form (off-axis) when patterns NOT peak-aligned	
$P_r = G_t G_r \left(\frac{\lambda}{4\pi R} \right)^2 P_t F_t(\theta_t, \phi_t) F_r(\theta_r, \phi_r)$	
F_t, F_r normalized patterns at the link directions; $F = 1$ when aligned.	
Recipe 1. $\lambda = c/f$. 2. Convert any dB gain to linear: $G = 10^{G_{\text{dB}}/10}$.	
3. Get G_t, G_r by antenna type:	
• named dipole $\rightarrow$ COMMON DIPOLE PARAMS ($G = D$ lossless)	
• aperture / dish $\rightarrow$ APERTURE ANTENNAS ($G = D \approx 4\pi A_p/\lambda^2$)	
• arbitrary pattern $F(\theta) \rightarrow$ BEAM PARAMS ($G = \xi \cdot 4\pi/\Omega_p$)	
• given in dB $\rightarrow$ dB $\leftrightarrow$ LINEAR table	
4. Plug into Friis.	
Use linear G , not dB. Convert FIRST.	

dB $\leftrightarrow$ LINEAR

Works for any power-like quantity (G , D , P_r/P_t , SNR , ...):	
$X_{\text{dB}} = 10 \log_{10} X_{\text{lin}}$	$X_{\text{lin}} = 10^{X_{\text{dB}}/10}$
Memorize: 3 dB $\Leftrightarrow \times 2$, 10 dB $\Leftrightarrow \times 10$. Add dB = multiply linear.	
For E-field / amplitude use $20 \log$ not $10 \log$ (power $\propto E^2$).	

NOISE & SNR

Noise power thermal noise into matched receiver	
$P_N = k_B T_{\text{sys}} B$ (W)	
$k_B = 1.38 \times 10^{-23}$ J/K; T_{sys} system noise temp (K); B receiver bandwidth (Hz).	
Signal-to-noise ratio	
$\text{SNR} = \frac{P_{\text{rec}}}{P_N}$ (unitless)	$\text{SNR}_{\text{dB}} = 10 \log_{10} \frac{P_{\text{rec}}}{P_N}$

APERTURE ANTENNAS (horn, dish; large aperture, $d \geq$ several λ)

A_p physical aperture area (m ²); A_e effective area (m ² , = $\lambda^2 D / 4\pi$); β_{xz}, β_{yz} HPBW's in two planes (rad); ℓ, d aperture side / diameter (m).	
Far-field req.: $R \geq 2d^2/\lambda$ (d = largest aperture dim.).	
Pattern (rect., uniform illum.) peak at $\theta = 0$ (broadside)	
$F(\theta) = \text{sinc}^2 \left(\frac{\pi \ell_x \sin \theta}{\lambda} \right)$; $S_0 = \frac{E_0^2 A_p^2}{2\eta_0 \lambda^2 R^2}$	
Directivity (any shape, uniform illum.)	
$D \approx \frac{4\pi A_p}{\lambda^2}$ (unitless) $\Rightarrow A_e \approx A_p$	
Directivity from beamwidths any aperture	
$D \approx \frac{4\pi}{\beta_{xz} \beta_{yz}}$ (use rad); circular: $D \approx 4\pi/\beta^2$	

HPBW and D by aperture shape uniform illum.; β in rad			
Shape	A_p	HPBW (rad)	D (unitless)
Rect. $\ell_x \times \ell_y$		$\beta_x \approx 0.88\lambda/\ell_x$ $\beta_y \approx 0.88\lambda/\ell_y$	$D \approx 4\pi/(\beta_x \beta_y)$ $= 4\pi \ell_x \ell_y / \lambda^2$
Square ℓ	ℓ^2	$\beta \approx 0.88\lambda/\ell$	$D \approx 4\pi/\beta^2$ $= 4\pi \ell^2 / \lambda^2$
Circular (diam. d)	$\pi d^2/4$	$\beta \approx 1.02\lambda/d$	$D \approx 4\pi/\beta^2$ $= \pi^2 d^2 / \lambda^2$

Scaling (any ratio) $D \propto A_p/\lambda^2$; $\beta \propto \lambda/\sqrt{A_p}$	
$D_{\text{new}} = D_{\text{old}} \cdot \frac{A_{p,\text{new}}}{A_{p,\text{old}}} \cdot \left(\frac{f_{\text{new}}}{f_{\text{old}}} \right)^2$	
$\beta_{\text{new}} = \beta_{\text{old}} \cdot \sqrt{\frac{A_{p,\text{old}}}{A_{p,\text{new}}}} \cdot \frac{f_{\text{old}}}{f_{\text{new}}}$	
If a parameter is unchanged, its ratio = 1. Examples: double area $\rightarrow D \times 2$, $\beta \times 1/\sqrt{2}$; double freq $\rightarrow D \times 4$, $\beta \times 1/2$.
